## CLP

### Overview

- Removable data storage medium that enables fast and simple replacement of SCALANCE components with a CLP slot without the need for a programming device in the event of a fault
- Can be used in all SCALANCE products with a CLP slot (e.g. SCALANCE W1788)
- For automatic backup of configuration data of SCALANCE components

### Benefits

- Quick and easy replacement of SCALANCE components without reconfiguration of the spare part
- Device replacement without the need for specially trained personnel, programming devices or PCs
- Downtimes of network segments and connected Industrial Ethernet nodes is minimized if a fault occurs.
- Memory expansion for software applications (e.g. in use with SCALANCE LPE)

### Application

The SCALANCE CLP is used in cases where the replacement of network components or communications modules needs to be quick and easy when a fault occurs, without having to configure the replacement part and without the need for specialist personnel. The CLPs can also be used as memory expansion for software applications.

### Design

The SCALANCE CLP has degree of protection IP20. The degree of protection of IP65/IP67 components is ensured by the design of the target device. The power supply is also provided by the terminal device.

The SCALANCE CLP is inserted in the slot provided on the SCALANCE component. The configuration data are automatically saved to the SCALANCE CLP during device start-up and reconfiguring.

If a device needs to be replaced, the SCALANCE CLP is simply removed from the failed component and plugged into the replacement device. The replacement device installed in the network or automation system now starts up automatically with the same device configuration as the failed device.

### Function

During startup, the device automatically backs up the configuration data on a blank SCALANCE CLP (delivery state) plugged into a SCALANCE component. Changes to the configuration data during operation are also saved on the SCALANCE CLP without the need for any additional operator intervention.

During startup, an unconfigured device automatically loads the configuration data from an inserted SCALANCE CLP that has been written to, provided the data was written by a compatible device type.

### Memory expansion

Depending on the functionalities of the SCALANCE component, the SCALANCE CLP can also be used as memory expansion. The SCALANCE CLP 32GB variant is designed, for example, for use within the Local Processing Engine SCALANCE LPE.

### Diagnostics

Incorrect use of the SCALANCE CLP, such as inserting a SCALANCE CLP containing the configuration of a different device group or general malfunctions of the SCALANCE CLP, are indicated by diagnostics mechanisms of the respective terminal device (LEDs, PROFINET, SNMP, web-based management, etc.).
